INFORMATION FOR AUTHORS

Full details of how to submit a manuscript for publication in Natural Product Communications are given in Information for Authors on our Web site http://www.naturalproduct.us.

Authors may reproduce/republish portions of their published contribution without seeking permission from NPC, provided that any such republication is accompanied by an acknowledgment (original citation)-Reproduced by permission of Natural Product Communications. Any unauthorized reproduction, transmission or storage may result in either civil or criminal liability.

The publication of each of the articles contained herein is protected by copyright. Except as allowed under national “fair use” laws, copying is not permitted by any means or for any purpose, such as for distribution to any third party (whether by sale, loan, gift, or otherwise); as agent (express or implied) of any third party; for purposes of advertising or promotion; or to create collective or derivative works. Such permission requests, or other inquiries, should be addressed to the Natural Product Inc. (NPI). A photocopy license is available from the NPI for institutional subscribers that need to make multiple copies of single articles for internal study or research purposes.

To Subscribe: Natural Product Communications is a journal published monthly. 2017 subscription price: US$2,595 (Print, ISSN# 1934-578X); US$2,595 (Web edition, ISSN# 1555-9475); US$2,995 (Print + single site online); US$595 (Personal online). Orders should be addressed to Subscription Department, Natural Product Communications, Natural Product Inc., 7963 Anderson Park Lane, Westerville, Ohio 43081, USA. Subscriptions are renewed on an annual basis. Claims for nonreceipt of issues will be honored if made within three months of publication of the issue. All issues are dispatched by air-mail throughout the world, excluding the USA and Canada.
Seven ferns of *Pteridaceae*, grown in a botanical garden or wild, harvested in France were investigated for their Volatile Organic Compounds (VOC) profile using GC-MS: *Adiantum pedatum* L., *Adiantum peruvianum* Klotzsch, *Anogramma leptophylla* (L.) Link, *Cheilanthes madorensis* Lowe, *Cryptogramma crispa* (L.) R. Br., *Pteris cretica* L. and *Pteris vittata* L. Fifty-three VOC biosynthesized from lipidic, shikimic, terpenic and carotenoid pathways were identified. The two *Adiantum* species show different VOC composition. The main linalool (10.8%) in *A. pedatum* has several biological activities of great interest. This Maidenhair fern contains the highest proportion (57.9%) of isoprenoid flavor precursors, i.e., ionone derivatives with various scent notes. The two major odorant unsaturated hexenoic acids derivatives of *A. peruvianum* are used as flavouring agents. *Anogramma leptophylla* concentrates 6-methoxymellein (71.5%), a bitter phytoalexin which contributes to stress or pathogen resistance. *Cheilanthes madorensis* produces mainly coumarin (89%) and vanillin (5.3%) with a low odor detection threshold, both used in perfumery and cosmetic industry as a perfume and drug additives. *Cryptogramma crispa* accumulates a broad-spectrum of carotenoid derivatives (52.1%) and three major shikimic derivatives: the spicy 4-vinylguaiacol (flavouring agent), the floral phenylethanol and benzyl alcohol with floral, balsamic scent. *Pteris cretica* accumulates mostly furan derivatives, i.e., 5-hydroxymethylfurfural (33.2%) and 3-hydroxy-2,3-dihydroxymalonal (18.3%) used as food and beverage additives with caramel or roasty flavour and also found in fortified wines, toasty or heat-treated foods. *Pteris vittata* produces predominately shikimic derivatives applied in perfumery and food industries as benzaldehyde (26%, with almond scent), benzyl alcohol (22%, floral fruity balsamic scent), nonanal (19.8% cucumber note) and phenylethanal (11%; floral note). *Pteridaceae* resources are of great interest as a reservoir of odorous and bioactive compounds.

**Keywords:** Benzaldehyde, Coumarin derivatives, Furan derivatives, Linalool, 6-Methoxymellein, Nonanal, 4-Vinylguaiacol.
With a view to continue our study of Volatile Organic Compounds (VOC) with bioactive potential, fresh aerial parts of seven ferns of Pteridaceae harvested in France were investigated for their VOC profile using GC-MS: Adiantum pedatum L., Adiantum peruvianum Klotzsch, Anogramma leptophylla (L.) Link, Cheilanthes maderensis Lowe, Cryptogramma crispa (L.) R. Br., Pteris cretica L. and Pteris vittata L.

In the concentrated diethyl ether extracts of the seven species, fifty-three components biosynthesized from lipidic, shikimic, terpenic and carotenoid pathways were identified (Table 1). The volatile fraction of the ferns represents about 0.01% of the fresh aerial materials.

* Relative percentage of the VOC based on the GC-MS chromatographic area; a RI = Retention Indices on SLB5MS column (Supelco); b NI = Non Identified
inflammatory, antioxidant, antifungal, antibacterial, antiparasitic, antitumoral activities [4-e-i]. This fern contained the highest proportion of isoprenoid flavor precursors (57.9%), i.e., mainly (E,E)-pseudoinonone (11%) with odor descriptors as sweet, waxy, citrus, floral balsamic, spicy [4a,j], 4-hydroxy-5,6-epoxy-ionol (13.4%), 3-hydroxy-5,6-epoxy-β-ionone (6.5%) and 9-methyl-α-ionol (5%).

Adiantum pervanum showed a VOC profile based on twenty-nine compounds, radically different from the previous Adiantum species: lipidic derivatives (54.6%) were mainly represented by (E)-3-hexenoic acid (23.3%) with honey odor and waxy, fruity or herbal notes [4a], (E)-2-hexenoic acid (19%) with fruity odor and 1-octen-3-ol (7.1%) with mushroom-like scent. The two major odorant hexenoic acids, used as flavouring agents, were previously found in other fern species such as Athyrium filix-femina, Gymnocarpium dryopteris, Polystichum setiferum, Pteridium aquilinum [5a,b] and plant allies (Equisetum palustre) [5c] but not in Adiantum capillus-veneris. In Venus-hair fern, (E)-2-decanal, lauric amide or (E)-2-heptenal were found in high quantities with a plastic or oxidized mutton fat odor [5a], also responsible for the unpleasant scent of “stink bug”. The VOC profiles of the three species of Adiantum are therefore different.

Carotenoid derivatives of A. pervanum (28.3%) were composed by small amounts of α-ionone, β-ionone and ionone derivatives, i.e., 3-hydroxy-5,6-epoxy-β-ionone. The VOCs from the shikimic pathway (12.1%) were represented by few compounds including benzyl alcohol (4.6%) also described in A. pedatum (Table 1) as well as 2-phenylethanol, vanillin or coumarin previously found in A. pedatum, A. pervanum and A. trapeziforme [5d]. Three minor terpenic compounds including limonene were also identified in A. pervanum (3.4%). This second Adiantum species, as well as the previously analysed Venus-hair fern, produced small amounts of terpenic derivatives. The five other ferns analysed in this work and belonging to four other genera of Pteridaceae did not produce any terpenic derivatives.

Ten VOCs were detected from Anogramma leptophylla. The volatile pattern was mainly based on lipidic derivatives (76%), i.e., the major 6-methoxymellol (71.5%) and the minor 6-hydroxymellol (1.8%) which are 3,4-dihydroisocoumarins. The former is a polyketide-derived phytolalexin well-known in the carrot and would contribute to pathogen or stress resistance. It is the first compound related to the bitterness of the carrot and its content varies in the commercial products with storage and processing conditions [6a-c]. Dihydroisocoumarins have been isolated from other plants species and also from macrofungi [6d,e]. The others VOC isolated from A. leptophylla were shikimic derivatives (22.1%), i.e., benzaldehyde (7.7%) widespread in plants and mushrooms with bitter almond odor and coumarin (7.8%) with pleasant scent. These VOCs are two aroma agents commonly used in perfume, cosmetic and food industries.

The volatile content of Cheilanthes madereensis was mainly dominated by shikimic derivatives (95.9%) essentially coumarin (89%. hay and dried herb odor), 3,4-dihydrocoumarin (3.4%; baylike, herbal, coconut note) and vanillin (5.5%; vanilla, sweetish smell) usually used in perfume and food industries [3h; 4a,b]. Such high content of coumarin and coexistence of its dihydro derivative as natural products are very rare. Recently, a Japanese group reported the similar data from the bryophyte, Takakia lepidioideae [3i], as those reported in the present paper. At the same time, chemophylogenetic relationship between both phyla (Pteridophytes and Bryophytes) has been fully discussed [3j].

The broad spectrum of volatile components identified in Cryptogramma crispa showed a VOC profile including nineteen identified compounds. Table 1 lists major carotenoid derivatives (52.1%), i.e., 3-hydroxy-5,6-epoxy-ionone, 9-methyl-α-ionol, 8-methyl-α-ionone, 4-hydroxy-7,8-dihydro-β-ionone and 3-o xo-α-ionol. Shikimic derivatives (40.2%) are mainly represented by three VOCs. 4-Ethenyl-2-methoxyphenol also called 2-methoxy-4-vinylphenol or 4-vinylguaiacol (10%) with powerful, clove-like, spicy, smoky odor is also a flavouring agent and a pheromone for insects [4b]; 7a,b]. It was previously found in a horsetail, Equisetum telmateia [5c]. Phenylethanal (8.8%) with floral odor (lilac, hyacinth, geranium; [3b, 4b]) was also identified in other ferns and plant allies (Athyrium filix-femina, Blechnum spicant, Phegopteris connectilis, Equisetum scirpioides) [5a-c]. The third shikimic derivative was benzyl alcohol (6.1%) with floral or balsamic odor. Only 1-octen-3-ol from lipidic pathway was identified in a significant amount (Table 1).

Table 1 lists a broad spectrum of VOCs for Pteris cretica based on twenty-seven identified components mainly lipidic derivatives (49.9%), shikimic derivatives (26.1%) and carotenoid derivatives (22.8%) in low amounts. Only two VOCs were abundant as 5-hydroxymethylfurfural (33.2%) and 3,5-dihydroxy-6-methyl-2,3-dihydro-4H-pyran-4-one (18.3%). The major 5-hydroxymethylfurfural is described with odor of chamomile flowers (or butter, caramel, musty) while the four others furan derivatives (10%) have various descriptors [8a-d] as furfural (almond, woody, sweet, toasty), furfuryl alcohol (faint burning odor), furanone (sweet, caramel, pineapple, strawberry) and 5-methylfurfural (caramel, almond, spicy, sweet, roasty). These compounds usually found in fortified wines, in roasted, toasted or heat-treated foods and drinks, are produced, in particular, by sugar alteration (Maillard reaction). Suspected but not proved to be carcinogenic, they contribute to caramel aroma and colour in food additives [8e-h]. 3,5-Dihydroxy-6-methyl-2,3-dihydro-4H-pyran-4-one (or 3-hydroxy-2,3-dihydrromaltol 18.3%, Table 1), the second major VOC exhalas an odor with toasty character and fruity-caramel overtones [7a].

Pteris cretica was the single species of the seven analysed ferns with a high level of furanone and furfural derivatives (43.2%, Table 1) whereas the others (in particular P. viitata) contain none at all. Furan derivatives were not found in A. capillus-veneris, another species from Pteridaceae previously studied [5a]. However, ferns species from other families may also produce furan derivatives in small amounts, i.e., Pteridium aquilinum, Asplenium trichomanes, and the twelve species of the Asplenioidae family [5b,9a]. Other authors found furan derivatives in coalified Trigonocarpus grandis [9b] or in aerial parts and rhizomes of current species of ferns: Angiopteris esculenta, Cibotium barometz, Coniogramme japonica, P. aquilinum, and five species of Polypodiaceae [9c-g].

Pteris viitata revealed a VOC fraction very different from that of P. cretica with a low diversity (ten volatile compounds), barely any carotenoid derivatives and a majority of shikimic derivatives (69.4%) with the three major odorant benzaldehyde (26%; bitter almond scent), benzyl alcohol (22%; floral notes) and phenylethanal (11%; sweet odor of hyacinth-type). These three VOCs were also detected in five others ferns of the same family analysed in this work but in lower amounts. Lipidic derivatives were represented by nonanal (19.8%; floral-waxy note, [7a]) and 1-octen-3-ol (9.5%; fungal aroma, [3b-d]) recently reported as antifungal agent [10a] and attractant for Anopheles and Aedes mosquitoes, repellent to Culex quinquefasciatus [10b], respectively.
This paper demonstrates that *Peridaceae* can generate a broad spectrum of VOCs for both odorous and bioactive ingredients. Within the former, lipidic derivatives, terpenic compounds and ionone derivatives with fruity odor, herbal scent or floral notes, are the main fragrant components required for cosmetic and hygiene products industries as well as aroma applications: it should be noted that surprising high amount of furan derivatives with caramel or roasty flavor was detected to be used as food additives. Within the last, coumarin derivatives are of various biological interests for pharmaceutical industry and in plant protection products. *Pteridaceae* species resources are potential candidates for bioactive aroma ingredients and for the discovery of new drugs with various therapeutic applications due to their potential anti-inflammatory [10c] and antitumor [10d] promoting properties.

**Experimental**

**Plant material:** Fresh aerial parts of ferns were collected in France, as follows: *Pteris cretica* and *Adiantum peruvianum*: 31/08/2010, Botanical Garden of Strasbourg; *Cryptogramma crispa*: 01/09/2010, Botanical Garden of Nancy; *Adiantum pedatum*: 01/09/2010, Botanical Garden of Col de Saverne; *Anogramma leptophylla*: 14/04/2010, Le Lavandou (Var);

*Chelanithes maderensis*: 13/04/2010, Rayol-Canadel-sur-Mer (Var); Voucher specimens are deposited at the Laboratory of Botany (Faculty of Pharmacy, Limoges, France).

**Plant part and GC-MS analyses:** Fresh aerial parts of ferns were cubed and extracted with diethyl ether (Carlo Erba, 6 ppm BHT). After one week of maceration at room temperature, the concentrated organic extracts were used for Gas Chromatography Mass Spectrometry (GC-MS) analyses as reported in the literature [5a–c]. The main volatile components of *Peridaceae* were identified by comparison with National Institute of Standards and Technology Mass Spectral Library [11a-b]. Internal standards (α-alkanes) were used as reference points in the calculation of relative retention indices. GC-MS analyses were performed at the « Plateforme d’Analyses Chimiques en Ecologie », technical facilities of the LabEx CeMEB (Centre Méditerranéen pour l’Environnement et la Biodiversité).

**Acknowledgments** – The authors greatly thank the Botanical Garden of Col de Saverne for providing *Adiantum pedatum*, the Botanical Garden of Strasbourg for providing *Adiantum peruvianum*, *Pteris cretica* and *Pteris vittata*, and the Botanical Garden of Nancy for providing *Cryptogramma crispa*.

527

**Chemical Constituents and Antinociceptive Activity of Plinia edulis Fruits Peels**  
Luciane Angela Nottar Nesello, Adriana Campos, Karla Capistrano, Fátima de Campos Buzzi and Valdir Cechein Filho  
527

**Chemical Constituents of the Different Parts of Colchicum micranthum and C. chalcedonicum and their Cytotoxic Activities**  
Gizem Gulsoy-Toplan, Fatih Goger, Ayca Yildiz-Pekoz, Simon Gibbons, Gunay Sariyar and Afiife Mat  
535

**Hairy Root Cultures of Eucaalyptus longifolia and Production of Anti-inflammatory 9-Methoxycanthin-6-one**  
Trang Thu Tran, Nam Trung Nguyen, Ngoc Bich Pham, Huy Nhat Chu, Trong Dinh Nguyen, Tadamitsu Kishimoto, Minh Van Chau and Ha Hong Chu  
539

**Eliciting Effect of Catharanthine on the Biosynthesis of Vallesiachotamine and Isovallesiachotamine in Catharanthus roseus Cambial Meristematic Cells**  
Jianhua Zhu, Shuijie He, Pengfei Zhou, Jiachen Zi, Jincai Liang, Liyan Song and Rongmin Yu  
543

**Anti-inflammatory Effect of Pratol in LPS-stimulated RAW 264.7 Cells via NF-κB Signaling Pathways**  
You Chul Chung, Sung-Min Park, Jin Hwa Kim, Geun Soo Lee, Jung No Lee and Chang-Gu Hyun  
547

**Flavonoid Aglycones and Glycosides from the Leaves of some Japanese Artemisia Species**  
Ayumi Uehara, Kazuhide Shimoda, Yoshinori Murai and Tsukasa Ishihina  
551

**LC-MS Identification of Proanthocyanidins in Bark and Fruit of six Terminalia species**  
Awantika Singh, Sunil Kumar and Brijesh Kumar  
555

**Protective Effects of Compounds in Bombax ceiba flower on Benzo[a]pyrene-Induced Cytotoxicity**  
Souichi Nakashima, Yoshimi Oda, Yuki Ogawa, Suki Nakamura, Miyako Uno, Mariko Kishimoto, Masayuki Yoshikawa and Hisashi Matsuda  
561

**Antioxidant and Cosmeceutical Activities of Agarum cribrosum Phlorotannin Extracted by Ultrasound Treatment**  
Kasira Phasanasophon and Sang Moo Kim  
565

**Bioactive Metabolites from a Hydrothermal Vent Fungus Aspergillus sp. YQ-13**  
Qianman Tao, Chahong Ding, Bibi Nazia Aucllko and Bin Wu  
571

**Osmanthus fragrans Flower Aqueous Extract and its Enriched Acesiose inhibit Melanogenesis and Ultraviolet-induced Pigmentation**  
Shuo Liu, Zhen Zhao, Zhijun Huo, Zhiru Xu, Yan Zhong, Xiaoling Wang, Yiting Yang and Zhiyong Wang  
575

**Synthesis of new A-conjugated Quinolone and Spiroindole Dammaranes by the Ozonolysis of 2,3-Indolodipterocarpol**  
Irina E.Smirnova, Elmira F. Khusnutdinova, Alexander N. Lobov and Oxana B. Kazakova  
581

**A New Cytotoxic Tetrahydroxanthene-1,3(2H)-dione Derivative from Uvaria cordata and Structure Revision of Valderramenol A**  
Duc Viet Ho, Hung Quoc Vo, Tho Huan Nguyen, Thao Thi Do and Hoai Thi Nguyen  
585

**Synthesis of Novel 2-Thioxothiazolidin-4-one and Thiazolidine-2,4-dione Derivatives as Potential Anticancer Agents**  
Alleni Suman Kumar, Rathod Aravind Kumar, Elala Pravardhan Reddy, Vavilapalli Satyanarayana, Jujula Kashanna, Boggu Jagan Mohan Reddy, Basireddy Venkata Subba Reddy and Jhillu Singh Yadav  
589

**A Short Step Conversion of Alkynyl Propargyl Sulfones into Six-Membered Cyclic β-Ketosulfones via an Amine-Induced Novel Ring Closure**  
Md. Ashraful Alam, Kazuaki Shimada, Hironobu Kamoto, Kasumi Shingo, Toshinobu Korenaga and Chizuko Kabuto  
593

**Synthesis of Sex Pheromones of the Citrus Leafminer (CLM) (Phyllocnistis citrella)**  
Alleni Suman Kumar, Vavilapalli Satyanarayana, Ahmad Alkazhim Alghamdi and Jiilhu Singh Yadav  
599

**Composition, Anti-inflammatory Activity, and Bioaccessibility of Green Seaweeds from Fish Pond Aquaculture**  
Andrea Ripol, Carlos Cardoso, Cláudia Afonso, João Varela, Hugo Quental-Ferreira, Pedro Pousão-Ferreira and Narcisa M. Bandarra  
603
